Code Grader: 'ndigits' recursion

(10 points possible)

Write a function called `ndigits`, that takes an integer `x` (either positive or negative) as an argument. This function should return the number of digits in `x`.

Hints

How to Move Digit-to-digit?

What happens when you divide an integer by 10? Can you use the whole number part or the the remainder?

This is an optional exercise, but great for extra practice!
